1: Introduction to the RCSB Protein Data Bank (PDB)

- PDB statistics
- Download a CSV file from the PDB site (accessible from “Analyze” > “PDB Statistics” > “by Experimental Method and Molecular Type”. Move this CSV file into your RStudio project and use it to answer the following questions:

```
db <- read.csv("Data Export Summary.csv", row.names=1)
head(db)
```

	X.ray	NMR	EM	Multiple.methods	Neutron	Other	Total
## Protein (only)	142303	11804	5999	177	70	32	160385
## Protein/Oligosaccharide	8414	31	979	5	0	0	9429
## Protein/NA	7491	274	1986	3	0	0	9754
## Nucleic acid (only)	2368	1372	60	8	2	1	3811
## Other	149	31	3	0	0	0	183
## Oligosaccharide (only)	11	6	0	1	0	4	22

Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

```
method.sums <- colSums(db)
round((method.sums/method.sums["Total"]) * 100, 2)
```

##	X.ray	NMR	EM	Multiple.methods
##	87.55	7.36	4.92	0.11
##	Neutron	Other	Total	
##	0.04	0.02	100.00	

- 87.55% by X-ray and 4.92% by EM.

Q2: What proportion of structures in the PDB are protein?

```
round((db$Total/method.sums["Total"]) * 100, 2)
```

```
## [1] 87.36  5.14  5.31  2.08  0.10  0.01
```

- 87.36%

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

- There are 1828 HIV-1 protease structures in the current PDB
- *The PDB format*

2. Visualizing the HIV-1 protease structure

- Using Atom Selections

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

- Skipped per in-class instructions

Q5: There is a conserved water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have (see note below)?

- Skipped per in-class instructions

VMD Structure visualization image

```
#! [] (vmdscene.png)
```

Rmd will not knit with the insertion of this picture as a png file..

Q6: As you have hopefully observed HIV protease is a homodimer (i.e. it is composed of two identical chains). With the aid of the graphic display and the sequence viewer extension can you identify secondary structure elements that are likely to only form in the dimer rather than the monomer?

- OPTIONAL per class 11 lab page

3. Introduction to Bio3D in R

```
library(bio3d)
```

- Reading PDB file data into R

```
pdb <- read.pdb("1hsg")
```

```
## Note: Accessing on-line PDB file
```

- To get a quick summary of the contents of the pdb object you just created you can issue the command `print(pdb)` or simply type `pdb` (which is equivalent in this case):

```
pdb
```

```
##
## Call: read.pdb(file = "1hsg")
##
## Total Models#: 1
## Total Atoms#: 1686, XYZs#: 5058 Chains#: 2 (values: A B)
##
## Protein Atoms#: 1514 (residues/Calpha atoms#: 198)
## Nucleic acid Atoms#: 0 (residues/phosphate atoms#: 0)
##
## Non-protein/nucleic Atoms#: 172 (residues: 128)
## Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]
##
## Protein sequence:

##
## + attr: atom, xyz, seqres, helix, sheet,
## calpha, remark, call
```

Q7: How many amino acid residues are there in this pdb object?

- 198

Q8: Name one of the two non-protein residues?

- MK1

Q9: How many protein chains are in this structure?

- 2

```
aa123(pdbseq(pdb))
```

Note that the attributes (+ attr:) of this object are listed on the last couple of lines. To find the attributes of any such object you can use:

```
attributes(pdb)
```

```
## $names
## [1] "atom"    "xyz"     "seqres"  "helix"   "sheet"   "calpha"  "remark"  "call"
##
## $class
## [1] "pdb" "sse"
```

To access these individual attributes we use the dollar-attribute name convention that is common with R list objects. For example, to access the atom attribute or component use `pdb$atom`:

```
head(pdb$atom)
```

```
##   type eleno elety alt resid chain resno insert      x      y      z o      b
